

The Architecture 2.0 Loop and the Migration of Human Judgment

Automating the inner multi-tool execution cycle relocates human engineering judgment to the input and output bookends

The Structural Inversion of Engineering Labor Across Epochs

ARCHITECTURE 1.0

Human operates INSIDE the execution loop

Architects manually draft RTL, write simulation scripts, parse timing logs, and tune microarchitectural knobs by hand. Cognitive effort is trapped in execution mechanics.

ARCHITECTURE 2.0

Human governs the TWO LOAD-BEARING BOOKENDS

Execution loop is automated across multi-tool chains. Human judgment is elevated to **intent formulation** at the input and **commitment authority** at the signoff boundary.
