Standard Arrangements for Architecture 2.0 Presentations

Three Canonical Archetypes: Plot Only, Plot with Side Text, Just Text

arch2.mlsysbook.ai

Archetype 1: A plot only

Use when the graphic is self-contained and visually rich, allowing the speaker to unpack details orally without competing text.

Source: Architecture 2.0, Chapter 1; Section 1.3. Ideal for keynotes, dense timelines, scaling frontiers, and architecture topologies.

Archetype 2: Plot with text on the side

Use when a diagram requires immediate domain contextualization, takeaway badges, or explicit constraint items alongside the graphic.

Layer 1: AI-Assisted

- Point syntax in frozen RTL
- Open-loop human review

Layer 2: AI-Driven

- Parameter search $\theta \in \Theta$
- Locked container; surrogates

Layer 3: AI-Native

- Zero structural template
- Closed-loop physical signoff

Source: Architecture 2.0, Chapter 1; Section 1.3. Ideal for lecture slides, teaching concepts, and guided visual walkthroughs.

Archetype 3a: Just text (Comparative card grid)

Use for multi-dimensional criteria or tradeoffs, grouping insights into balanced, color-coded thematic columns.

Architecture quality

- Performance, power, and area
- Thermal and reliability limits
- Software and compiler fit

Total cost

- Model inference and tokens
- EDA license server queue time
- Human review and triage effort

Failure behavior

- Non-synthesizable candidates
- Silent constraint tampering
- Unsafe or uncontrolled actions

Source: Architecture 2.0, Chapter 1; The Architecture 2.0 Bet.

Archetype 3b: Just text (Decision flow & alerts)

Use to establish sequential evaluation gates, formal handoffs, or boundary conditions across an end-to-end workflow.

None of these early milestones authorizes architecture commitment without physical signoff.

Source: Architecture 2.0, Chapter 1; Four Distinct Success Claims.

Archetype 3c: Just text (The big thesis banner)

Use to establish an authoritative axiom, counter-intuitive insight, or keynote turning point.

**A foundation model does not design a chip.
The surrounding verification harness designs the chip.**

The Common Assumption

- Generative models replace engineers by emitting raw RTL text in isolation.

The Architectural Reality

- Value is created when physical signoff oracles bound and guide the search space.
