
source record
artifacts + data
methods + tools
checks + limits
conclusion
admission check
compare decisions
boundary + objective
error cost match?
pass → stages 1–4
1. transfer units
data + state
methods + ifaces
checks + artifacts
dependencies
2. dependencies
trace material change
to dependent claims
and interfaces
3. target actions
carry / update
retrain or
recalibrate
replace / retire
4. target checks
check affected units
and each interface
to changed neighbors
target decision
new comparison
target measurements
supported conclusion
components may move; the source conclusion does not
keep it attached to the source conditions and limits
selective reopening
reopen only claims affected by material changes
integration obligation
changed interfaces require
checks with neighbors
source component
meaning comes from dependencies
target context
changed neighbors reopen
dependent claims
qualified target use
new checks support a new decision
