State the architecture decision and output
comparator + constraints + legal actions + budget
Could an added method improve the result or lower the total cost?
no
Use direct or conventional work
retain the credible simpler path
yes
Which work limits the next decision?
one or more shortages may apply
Missing artifact
consider generation
Costly outcome
consider prediction
Too many choices
consider optimization
Sequential state
transition model or sequential optimization
Checking saturated
improve checks or reduce arriving work
End every route at the evaluator, fallback, and stop
declare support + total cost + named check + recovery path + stopping condition
reject the method when any of these cannot support the consequence
