(a) Layer 1: Point assistance

Inputs	Permitted work	Feedback and result
Task within an established design	Draft or analyze one local artifact	Engineer checks result and selects next action

(b) Layer 2: Container-bound optimization

Inputs	Permitted work	Feedback and result
Workload, constraints, and prescribed template	Search choices encoded in the fixed template	Tool results guide parameter selection

(c) Layer 3: AI-native design system

Inputs	Permitted work	Feedback and result
Requirements, limits, and correctness contract	Revise hardware and software beyond the template	Physical feedback guides joint revision

Each layer needs checks appropriate to its claims.
A study may return candidates, limits, or an unresolved result.

Moonshot target: a complete implementation that passes signoff.
